

Chapter 13: Volcano Seismology (Joachim Wassermann, Jürgen Neuberg)

(Note: New contributions/topics are marked **in red**)

13.1	Introduction.....	1
13.1.1	Why a different chapter	1
13.1.2	Why using seismology when forecasting volcanic eruptions	2
13.2	Classification and source models of volcano-seismic signals	3
13.2.1	Transient volcano-seismic signals	3
13.2.1.1	Volcanic-Tectonic events (deep and shallow)	3
13.2.1.2	Low-Frequency events	4
	13.2.1.3 Swarms of seismic events	7
13.2.1.4	Explosion quakes, ultra-low-frequency events	7
13.2.2	Continuous volcanic-seismic signals	11
13.2.2.1	Volcanic tremor (low-viscous two-phase flow and eruption tremor)	11
13.2.2.2	Volcanic tremor (high-viscous)	12
13.2.2.3	Surface events.....	14
13.2.3	Special note on noise	16
13.3	Design of a monitoring network	18
13.3.1	Station site selection	18
13.3.2	Station distribution.....	18
13.3.3	Seismic arrays in volcano monitoring.....	19
13.3.4	Network of seismic arrays	19
	13.3.5 Communication Lines	
13.4	Analysis and methodology.....	22
13.4.1	One-component single station	22
13.4.1.1	Spectral analysis	22
13.4.1.2	Envelope, RSAM and cumulative amplitude measurements.....	24
	13.4.1.3 Material Failure Forecast Method (FFM)	
13.4.2	Three-component single station.....	26
13.4.2.1	Polarization.....	27
13.4.2.2	Polarization filters	27
13.4.3	Network	28
13.4.3.1	Hypocenter determination by travel-time differences	28
	13.4.3.2 Cross correlation of diffusive wavefield	
	- (Campillo)	
13.4.3.2	Amplitude - distance relationship	
	- (e.g., Jolly and others, Scattering)	31
	13.4.3.3 Moment Tensor Inversion (Method)	
13.4.4	Seismic arrays.....	31
13.4.4.1	f-k beamforming.....	31
13.4.4.2	Array polarization.....	34
	13.4.4.3 Array analysis of non-planar wavefronts	
13.4.4.3	Hypocenter determination using seismic arrays	34
13.4.5	Automatic analysis.....	35
	- List of possible software packages with applications for volcano seismology	

- 13.4.5.1 Automatic Classification/Detection**
 - Self Organized Maps, Neuronal Networks, Hidden Markov Models, Template Based Pattern recognition
- 13.4.5.2 Automatic Source Location**
 - pick based, waveform or coherency based, amplitude-distance modules etc.
- 13.4.5.3 Automatic Standard Tools**
 - SSAM, RSAM etc.

13.5 Interpretations and Source Models

13.5.1	Volcano seismicity and magma flow models	
13.5.2	Volcano-Tectonic events and the associated stress field	
-	regional stress field	
-	magma induced stress	
13.5.2.	Low frequency events and swarms	
-	resonance models: dykes, conduits and cracks	
-	trigger: stick slip, magma rupture	
13.5.3	Constraints through seismic moment tensor inversions	
13.5.4	Volcano seismicity as a forecasting tool	
13.5	Other monitoring techniques.....	36
13.5.1	Infra Sound	
	(New important field for validation of surface activity and estimation of eruption strength; closely related to seismology)	
13.5.2	Ground deformation.....	36
	(tilt, strainmeter measurements, GPS, InSAR, ground base InSAR (see 13.5.5))	
13.5.3	Micro-Gravimetry.....	37
13.5.4	Geochemical gas-monitoring.....	38
	(CoSPEC, DOAS, FTIR - ground based and remote)	
13.5.5	Thermal and video surveillance	
13.5.6	Laboratory studies	
	List of possible parameter estimated out of these studies	
13.5.5	Meteorological parameters	39
13.6	Technical Considerations.....	39
13.6.1	Site and Vault	39
13.6.2	Sensors and digitizers	41
13.6.3	Analog versus digital telemetry	41
13.6.4	Power considerations	42
13.6.5	Data center	43
13.7	References.....	43
