## **CONTENTS:**

**Introduction**

**Ray paths for main phases**

**Description of Travel Time Tables**

**Travel Time Tables**

Body Waves

Core Reflections

Core Phases

Differential times for depth phases

Summary tables at constant range

Summary tables for major phases

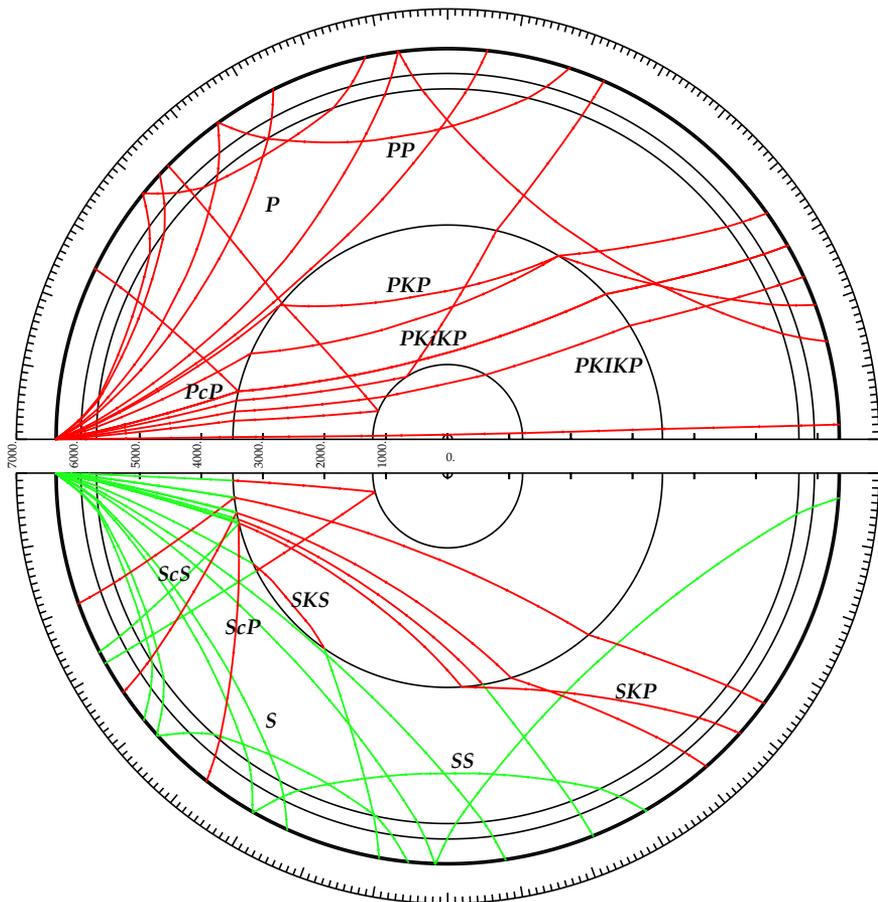

Summary travel time plots

**Ellipticity correction tables:**

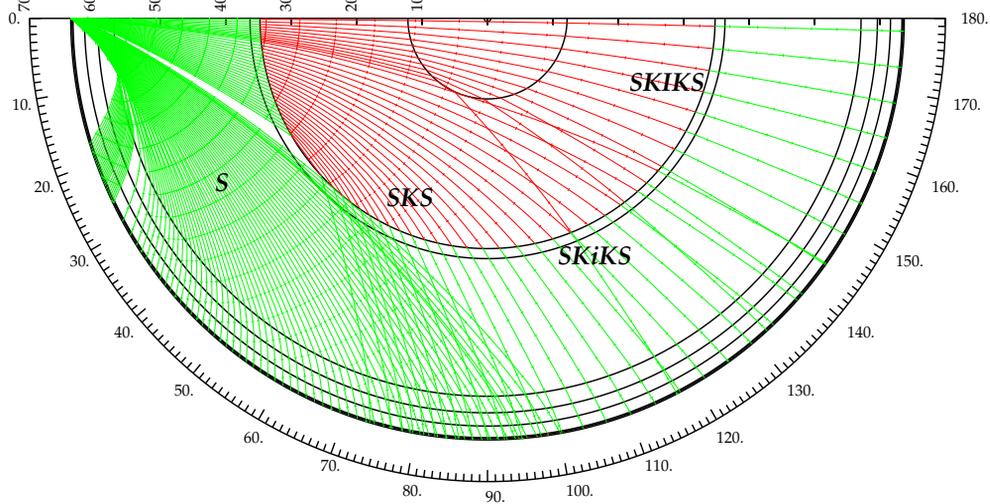

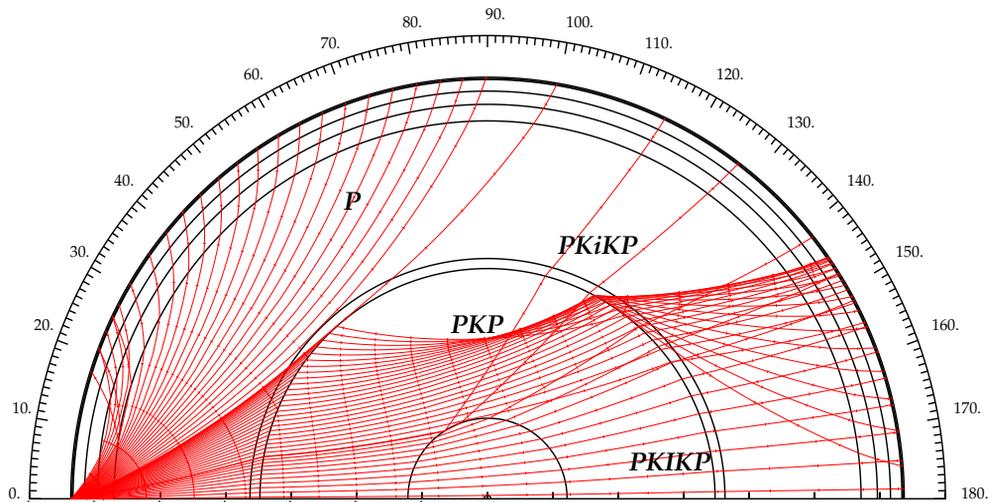

## **Introduction:**

The *ak135* tables represent an update of the *iasp91* travel time tables (Kennett & Engdahl, 1991) to try to match the behaviour of a wider range of phases. The construction process for the *ak135* model was described by Kennett, Engdahl & Buland (1995), and was based on new empirical travel time tables obtained by relocating events using the *iasp91* model. Like its predecessor, *ak135* is a radially stratified velocity model and the travel time tables are derived from the model so that a consistent basis exists for all phases. The P wave travel times are very similar to *iasp91*, but more significant changes are introduced for S and particularly the core phases. The *ak135* tables have been used as the basis for the systematic relocation of events by Engdahl, van der Hilst & Buland (1998) and the subsequent updates of their catalogue.

Because the times for all phases are derived from the same velocity model, there is complete consistency between the travel times for different branches at different hypocentral depths. The calculation scheme adopted for the *ak135* tables is that proposed by Buland & Chapman (1983). Tables of delay time as a function of slowness are stored and interpolated using a specially designed tau-spline system which takes care of square-root singularities in the derivatives of the travel times for a source at arbitrary depth. A further advantage over standard tables is that exactly the same procedure can be used for each phase. It is therefore possible to generate extremely rapidly a comprehensive list of travel times for the main seismic phases which could be observed at given epicentral distance.

## **Ray paths for main phases**

## Description of Travel Time Tables:

This book of tables is intended to provide a convenient reference for the travel times for the major seismic phases and is organised into four sections.

### 1. TRAVEL TIME TABLES FOR P AND S BODY WAVES:

The tables for P and S body waves are presented at  $1^\circ$  intervals from  $0$  to  $125^\circ$  for source depths of:

0, 15, 35, 50, 100, 150, 200, 250,  
and  
300, 350, 400, 450, 500, 550, 600, 650 and 700 km.

For each distance and depth, the travel time is presented in minutes and seconds and is accompanied (in italics) by the corresponding slowness value in seconds/degree.

### 2. TRAVEL TIME TABLES FOR CORE REFLECTIONS AND CORE PHASES:

This group of tables is displayed in a similar format to the body wave tables (i.e. time in minutes and seconds with associated slowness in italics) with  $1^\circ$  sampling at a common set of source depths: 0, 335, 50, 100, 200, 300, 500, and 700 km.

#### *Core reflections:*

PcP:	0-98°
ScS:	0-98°
ScP:	0-62°

#### *Core Phases:*

PKPdf:	114-180°	(PKIKP)
PKPab:	145-180°	
PKPbc:	145-155°	
SKSac:	62-144°	
SKSdf:	103-180°	(SKIKS)
SKP :	110-180°	(first arrival for phase)

### 3. DEPTH PHASES

The differential times for the principal depth phases associated with the body waves are displayed at 1° intervals for a wide range of source depths: 15, 35, 50, 100, 150, 200, 250, 300, 400, 500, 600, and 700 km.

*Differential time tables:*

pP-P: 2-100°

sP-P: 2-100°

sS-S: 2-100°

pS-S: 22-100°

### 4. SUMMARY TABLES AT CONSTANT RANGE

In order to aid work in phase association we present a new form of tables organised to display the travel times for a wide range of seismic phases at a fixed range. Tables are presented at 2° intervals from 0 to 180°, for source depths of 0, 100, 300 and 600 km.

For each distance and source depth, the travel times for the seismic phases are shown in minutes and seconds together with the slope of the travel time branch in seconds/degree.

The phases displayed are:

*P phases –*

P, Pdiff, PP, PcP, PKP, PKiKP, PKKP, PKPPKP (P'P')

*Depth phases:*

pP, pPdiff, pPKP, pPKiKP

sP, sPdiff, sPKP, sPKiKP

*S phases –*

S, Sdiff, SS, ScS, SKS, SKKS, SKSSKS (S'S')

*Depth phases*

sS, sSdiff, sSKS

pS, pSdiff, pSKS

*Converted phases –*

SP, ScP, SKP, SKKP

PS, PcS, PKS, PKKS

The various branches of the core phase are identified in the tables by lower case suffices.

## 5. SUMMARY TABLES FOR MAJOR PHASES

Phase times and slownesses are shown at  $1^\circ$  intervals for a selection of important phases, with separate tables for 0, 100, 300 and 600 km depth

1. Mostly mantle phases out to  $124^\circ$   
P, PP, PcP, S, SS, ScS, ScP, SKSac
2. Mostly core phases from  $110^\circ$ - $180^\circ$   
PKPab, PKPbc, PKPdf, PP, SKSac, SKSdf, SKP, SS

## 6. SUMMARY TRAVEL TIME CHARTS

A set of travel time charts for the four source depths 0, 100, 300 and 600 km, for all the tabulated phases.

These include travel time as a function of epicentral distance as well as slowness/distance and Tau/slowness.

## Ellipticity Correction Tables

Since the Earth is not a perfect sphere there is a need to allow for the effect of ellipticity when calculating the travel time between source and receiver over extended paths. A set of tables in the formulation of Dziewonski & Gilbert (1976) are presented at 5° intervals for the set of source depths which are common to the earlier detailed tables i.e. 0, 35, 50, 100, 200, 300, 500 and 700 km for a selection of phases:

*P phases*

P, PcP, PKPab, PKPbc, PKPdf (PKIKP)

*S phases*

S, ScS, SKSac, SKSdf (SKIKS)

*Converted phases*

ScP, SKP

The calculation of the ellipticity coefficients were made for the iasp91 velocity model using the algorithms presented by Doornbos (1988) with the density distribution from the PEM-C model of Dziewonski, Hales & Lapwood (1975) and the assumption that the ellipticity is nearly hydrostatic.

### **Core Phases:**

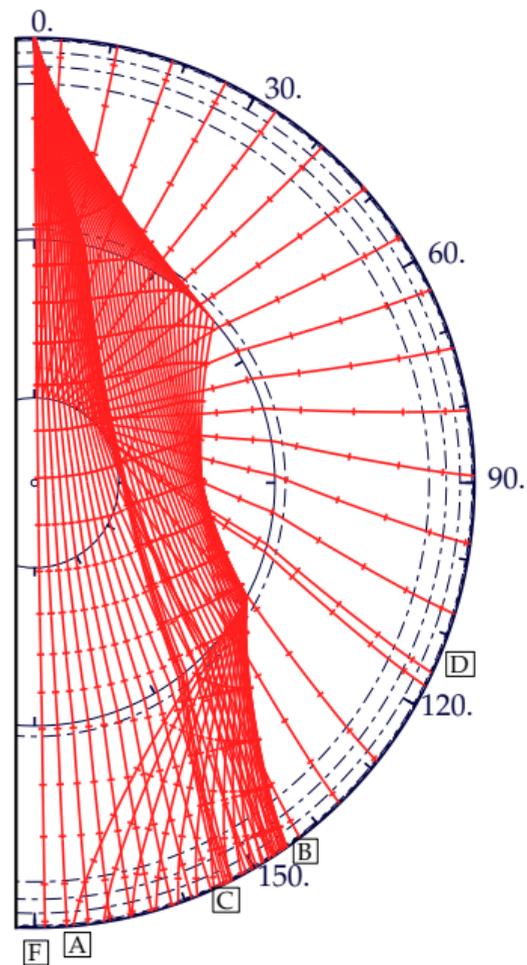

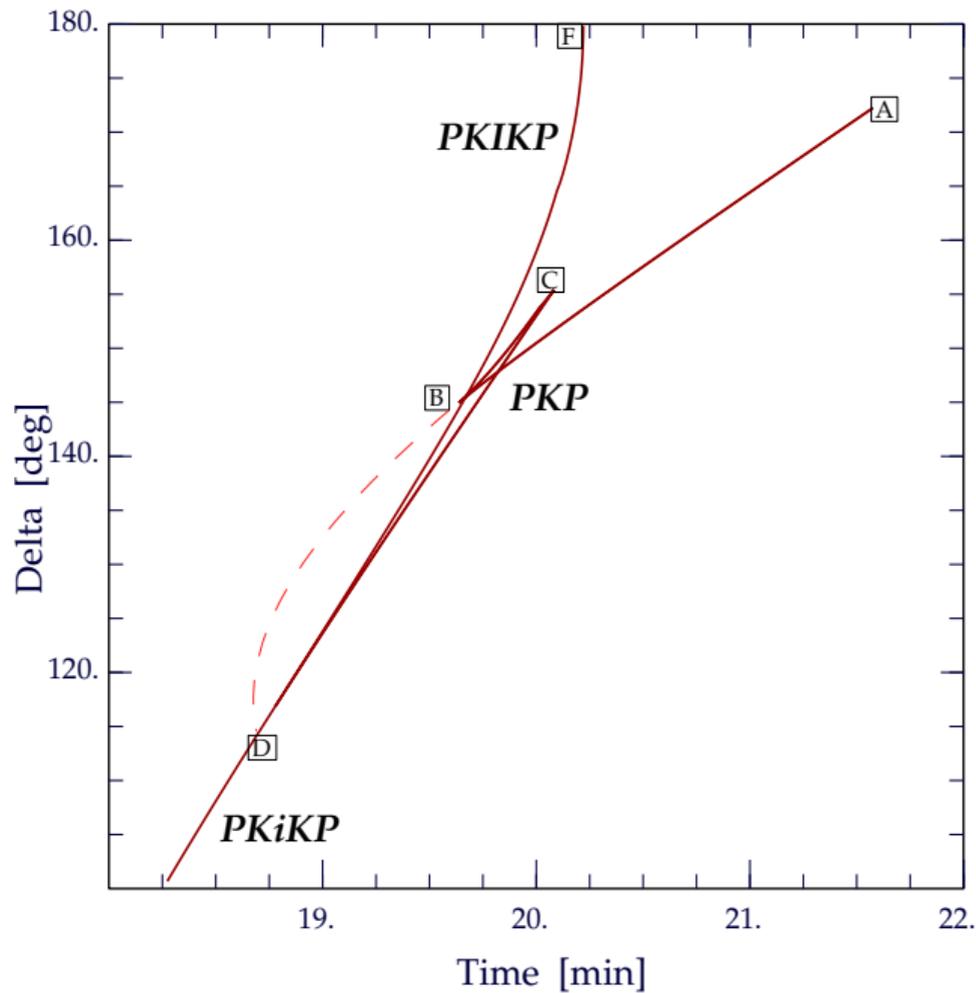

The P wavespeed at the top of the outer core is lower than the P wavespeed at the base of the mantle but higher than the S wavespeed at the same location.

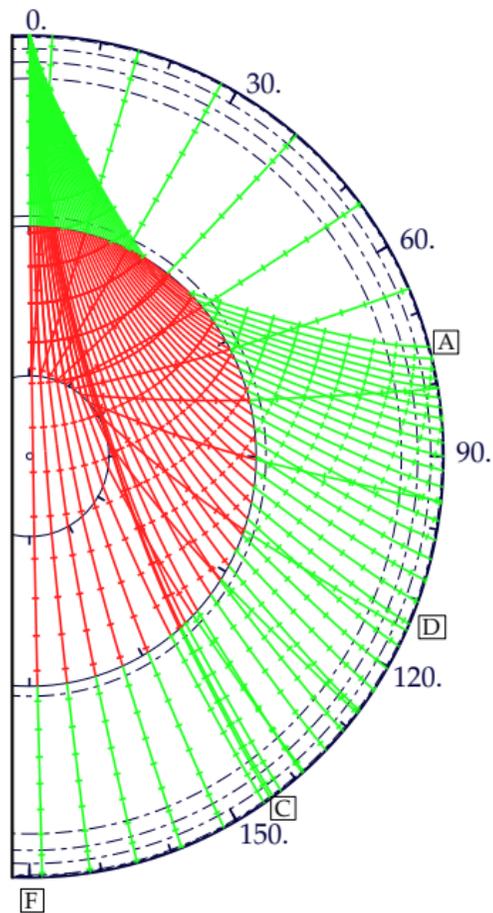

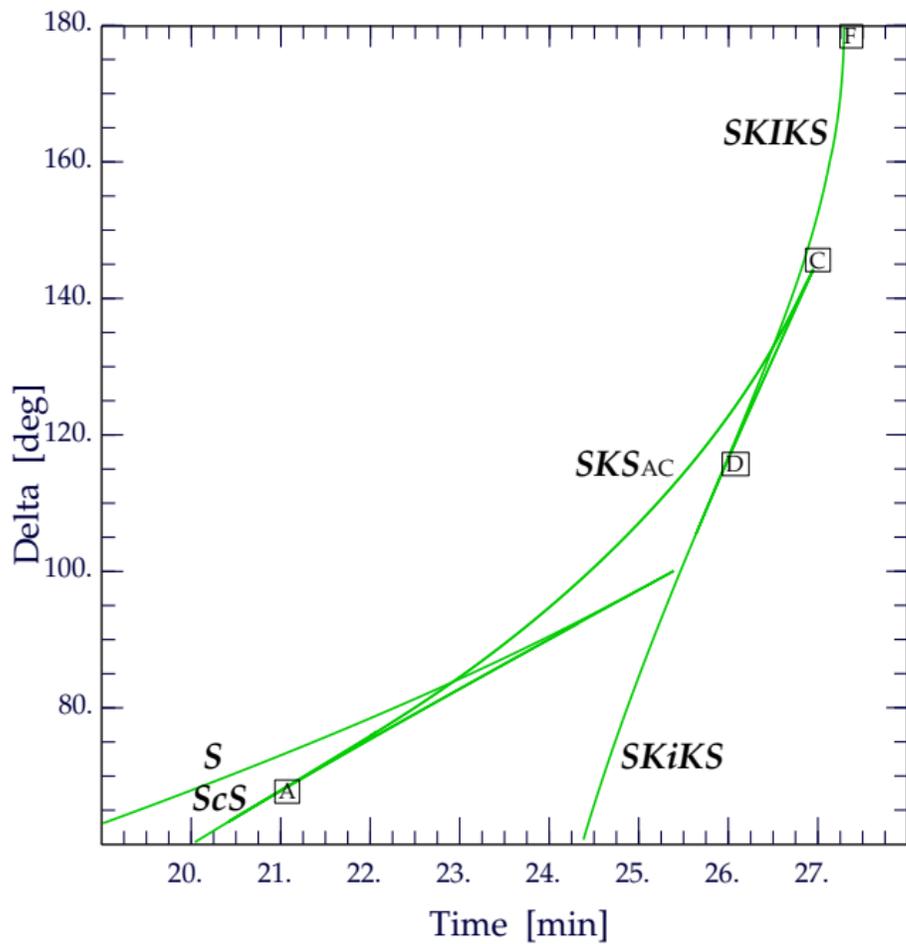

The outer part of the core of the Earth therefore acts as a low velocity zone for P waves leading to a shadow zone for P and a complex set of branches for the PKP phases illustrated opposite. The B point corresponds to the PKP caustic. The DF branch penetrates the inner core and corresponds to PKIKP.

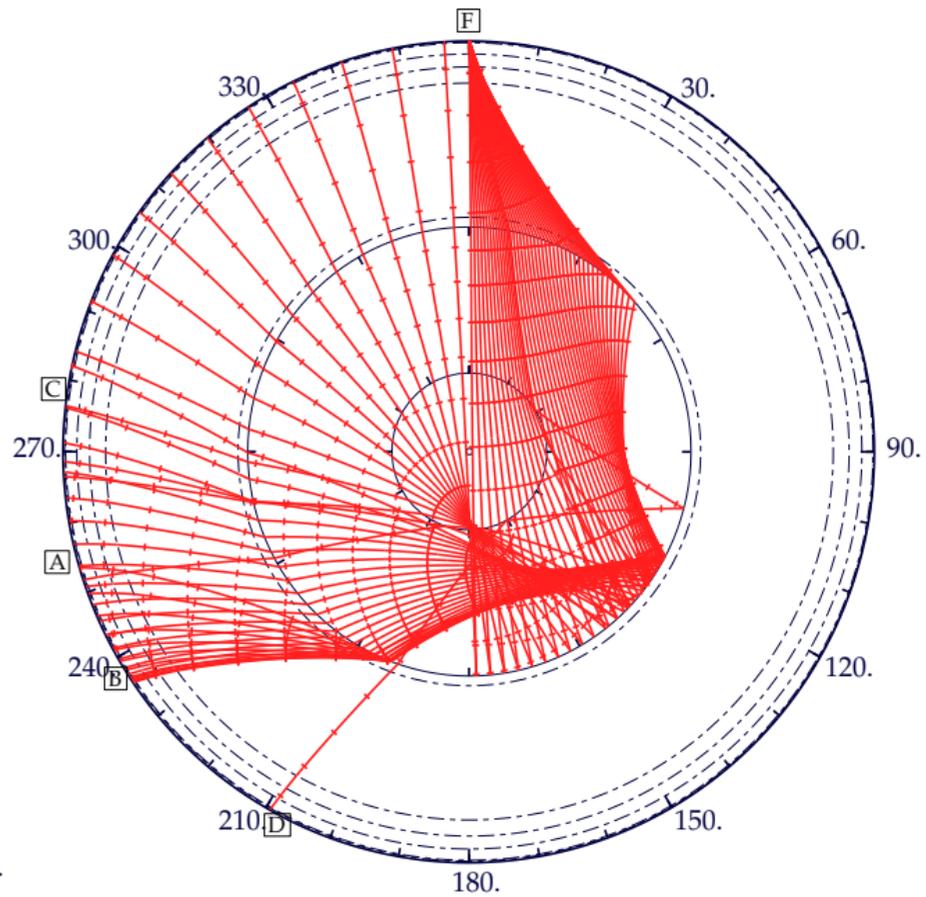

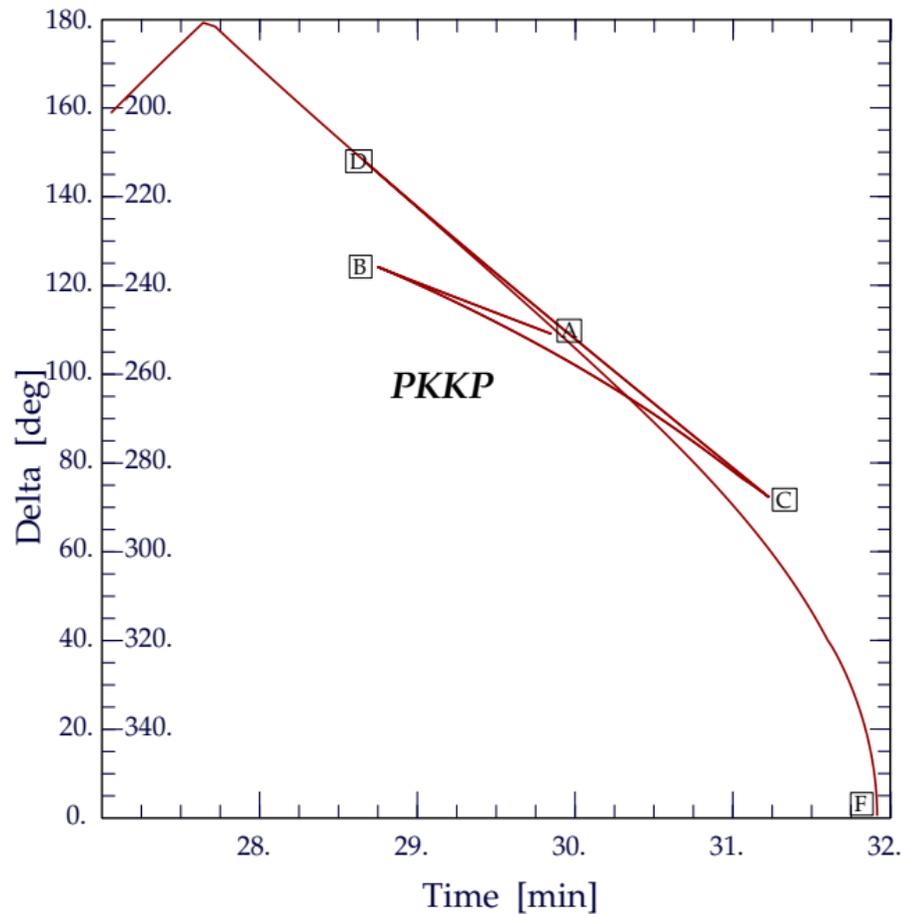

For SKS, the P wave leg in the core is faster than S in the mantle and so SKS overtakes S. The DF branch again penetrates the inner core and corresponds to SKIKS.

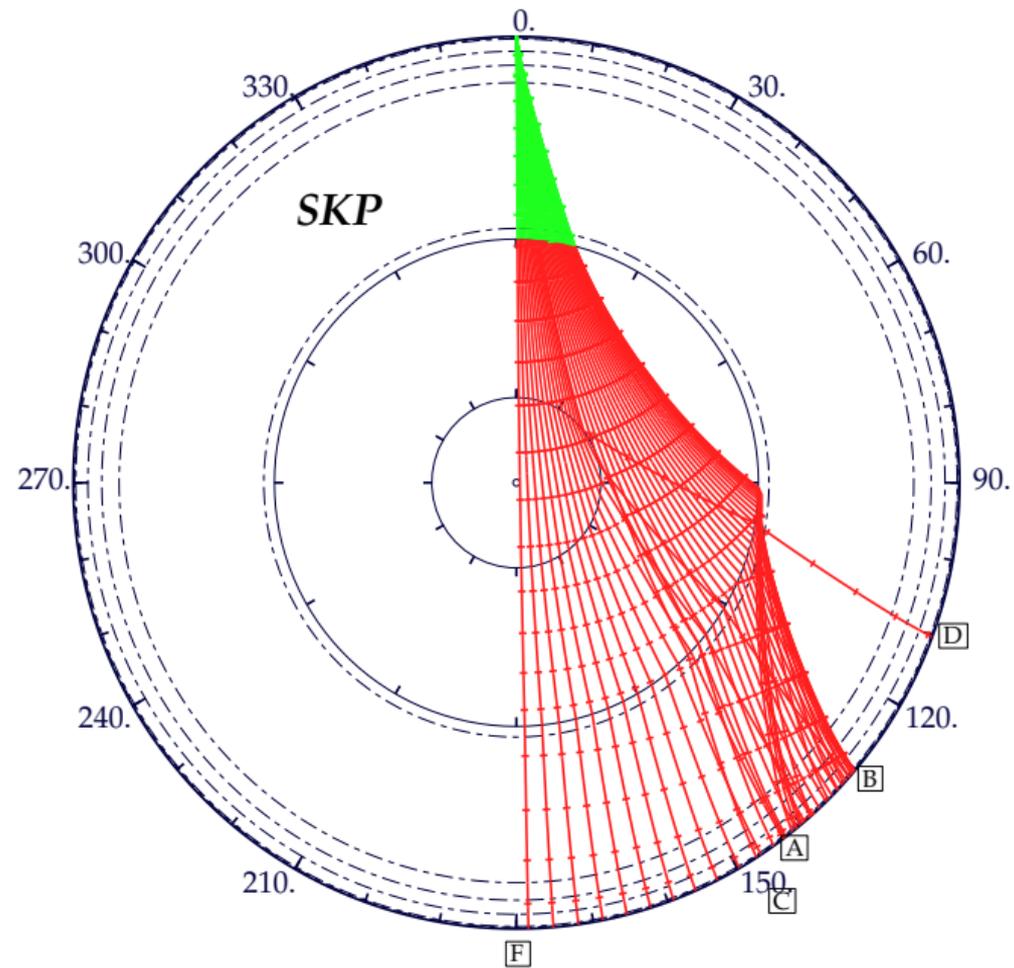

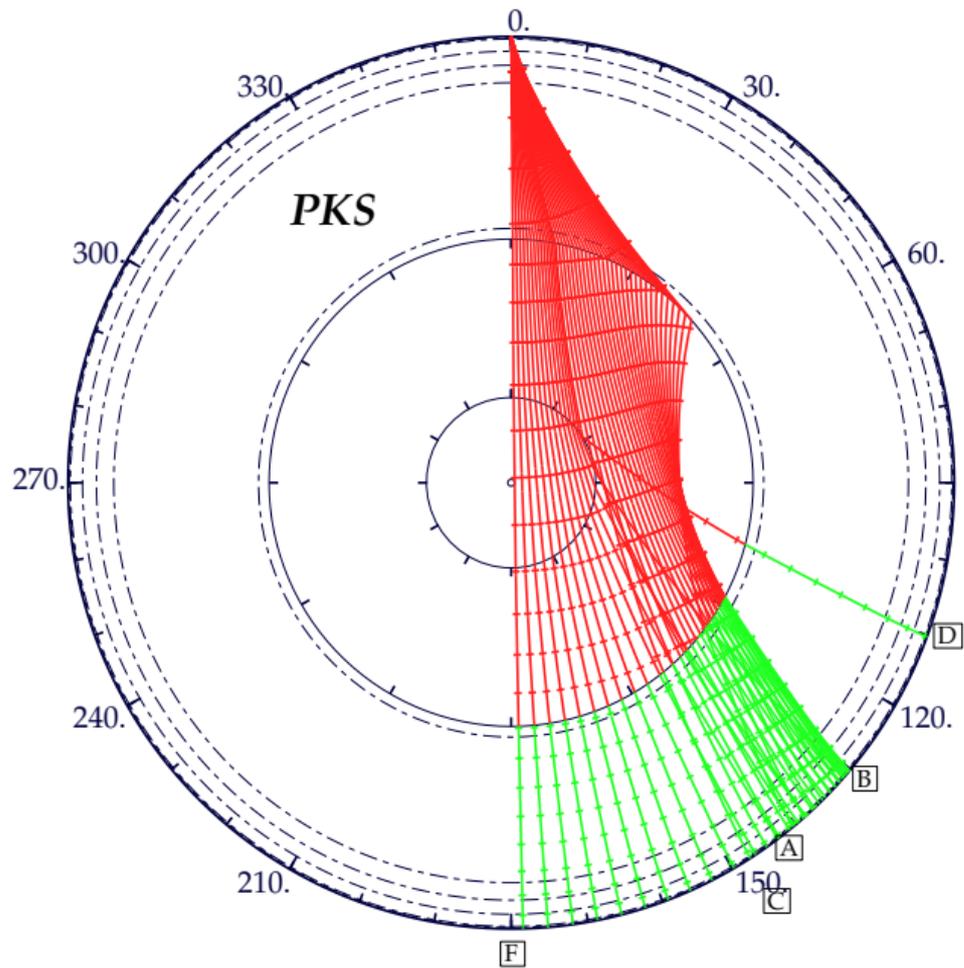

In the tables the branches of the PKP, SKS and other core phases are designated by lower case suffices e.g. PKPab for the AB branch of PKP.

The ray and travel time charts show the configuration of the branches for PKP, SKS and PKKP. Ray diagrams for PKS and SKP show the different propagation paths for these two phases with similar times.

## PKPab

## **Differential times for Depth Phases**

The differential times for the principal depth phases associated with the body waves are displayed at  $1^\circ$  intervals for a wide range of source depths: 15, 35, 50, 100, 150, 200, 250, 300, 400, 500, 600, and 700 km.

*Differential time tables:*

pP-P: 0-100°

sP-P: 0-100°

sS-S: 0-100°

pS-S: 20-100°

### **Summary Tables at Constant Range:**

In order to aid seismic phase association we display the travel times for a wide range of phases at 2° intervals from 0 to 180° with source depths of 0, 100, 300, and 600 km at each range.

The phases displayed are:

*P phases* –

P, Pdiff, PP, PcP, PKP, PKiKP, PKKP, PKPPKP (P'P')

*depth phases:*

pP, pPdiff, pPKP, pPKiKP

sP, sPdiff, sPKP, sPKiKP

*S phases* –

S, Sdiff, SS, ScS, SKS, SKKS, SKSSKS (S'S')

*depth phases:*

sS, sSdiff, sSKS

pS, pSdiff, pSKS

*Converted phases* –

SP, ScP, SKP, SKKP

PS, PcS, PKS, PKKS

The various branches of the core phases are identified in the tables by lower case suffices.

## **Summary Tables for Major Phases**

Phase times and slownesses are shown at 1° intervals for a selection of important phases, with separate tables for 0, 100, 300 and 600 km depth

- 1 Mostly mantle phases out to 124°  
P, PP, PcP, S, SS, ScS, ScP, SKSac
  
- 2 Mostly core phases from 110°-180°  
PKPab, PKPbc, PKPdf, PP, SKSac, SKSdf, SKP, SS

Depth : 0.0 km

## Summary Travel Time Charts

For depths 0, 100, 300, 600 km

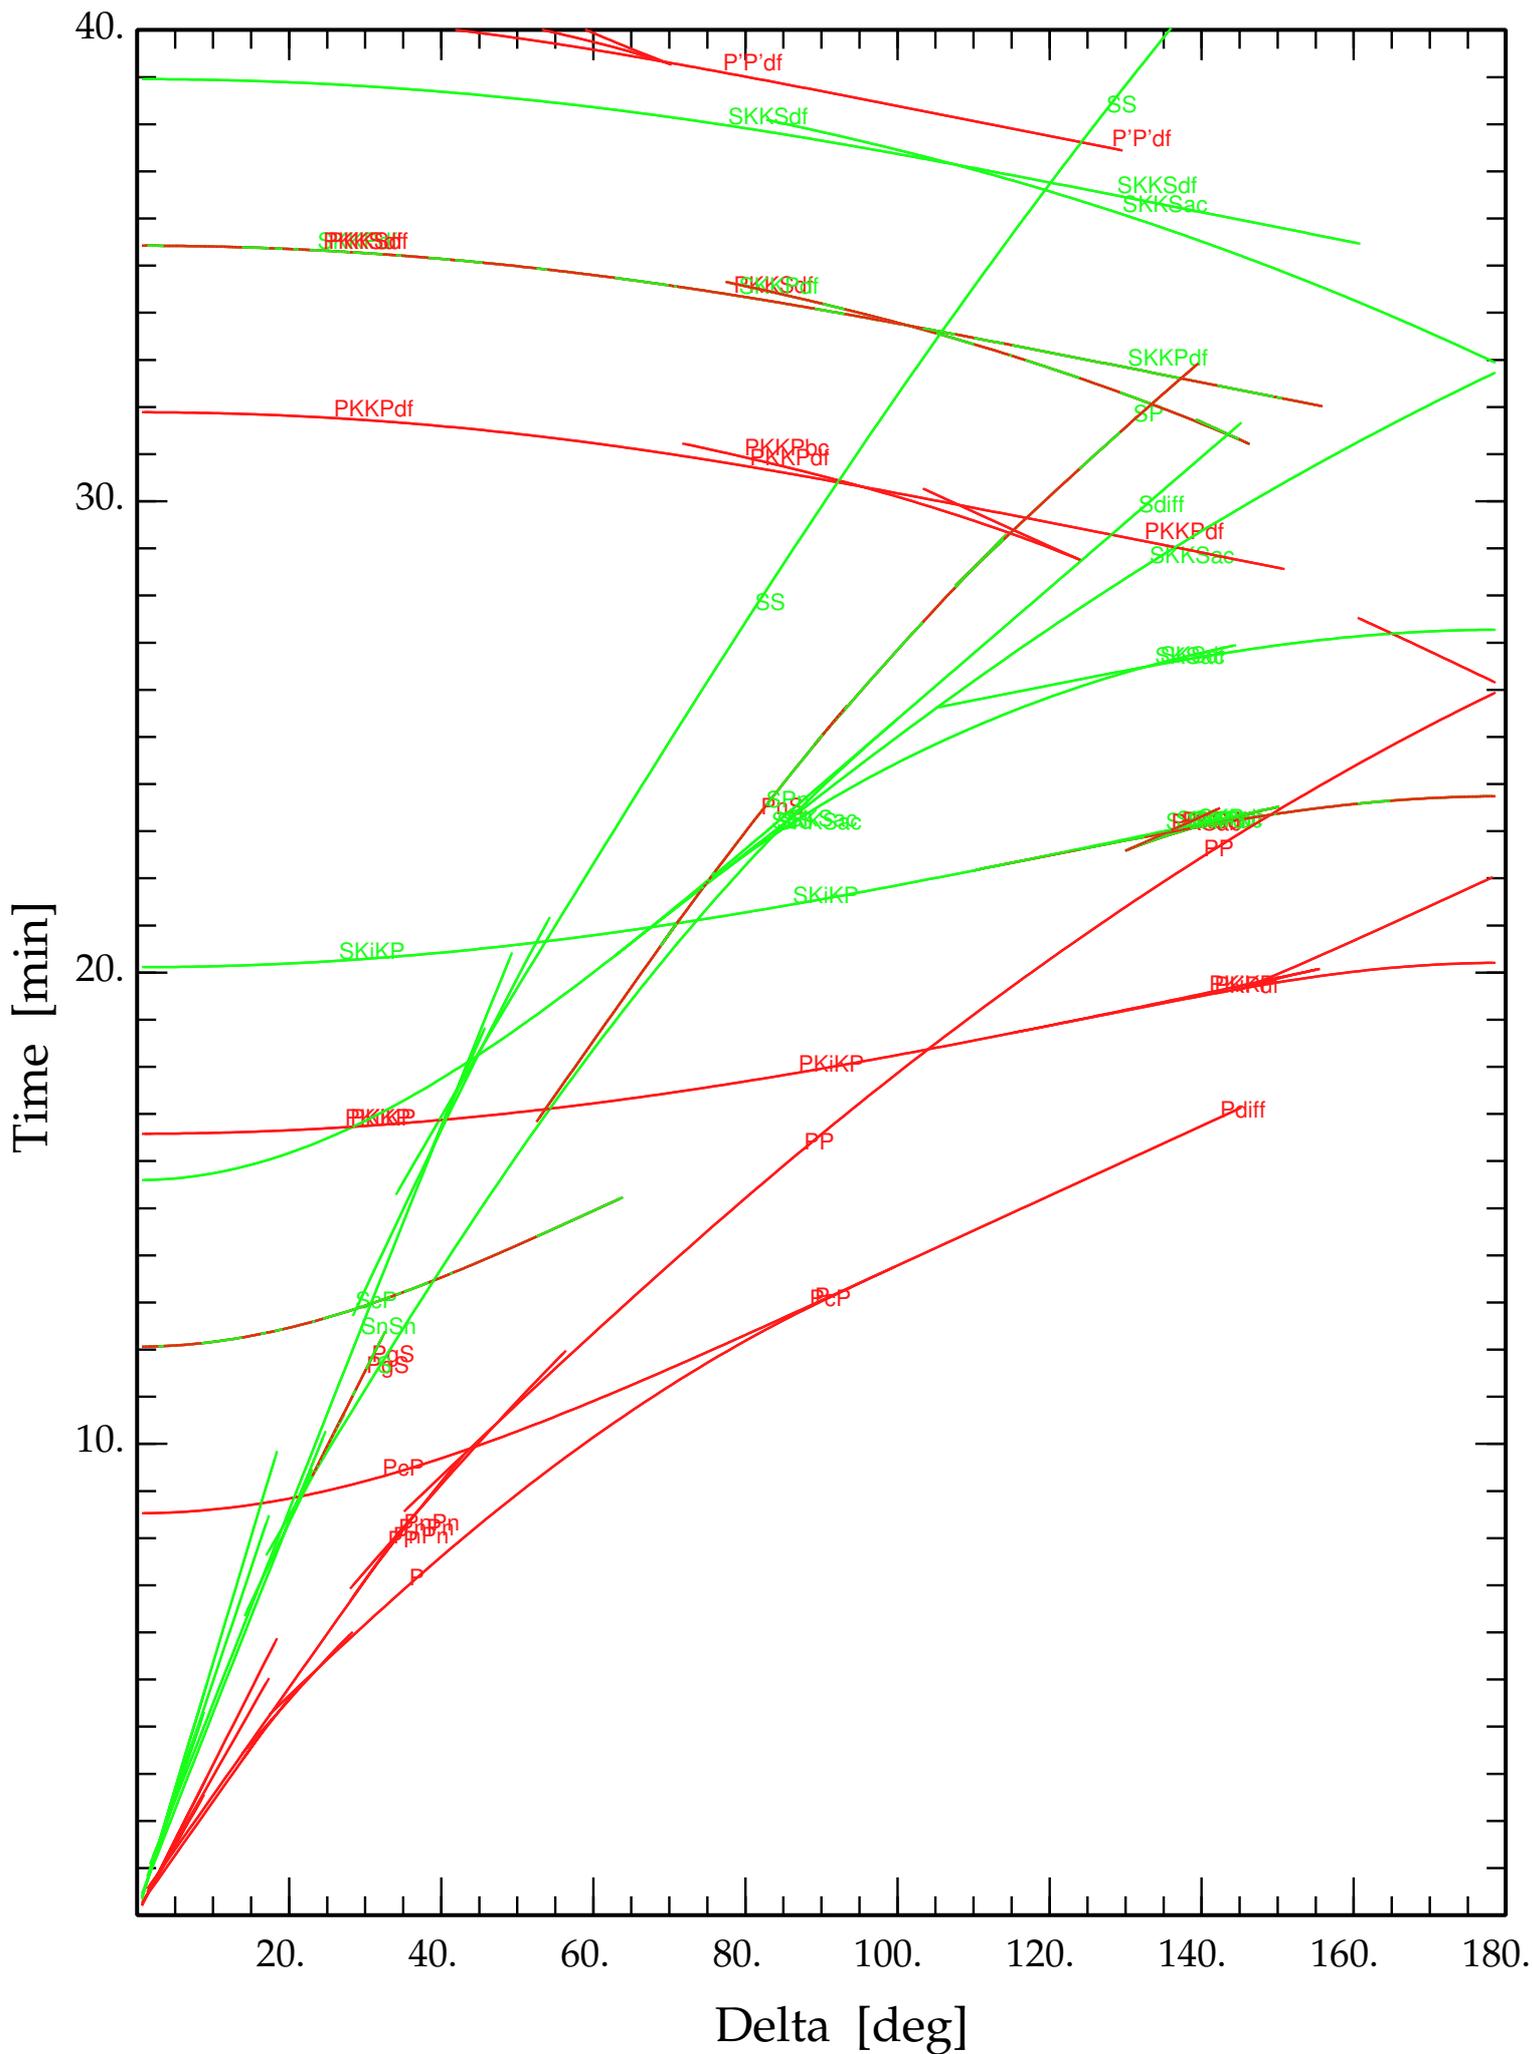

Time/Delta:

Slowness/Delta

Tau/Slowness

Differential Times for major P-S phase pairs

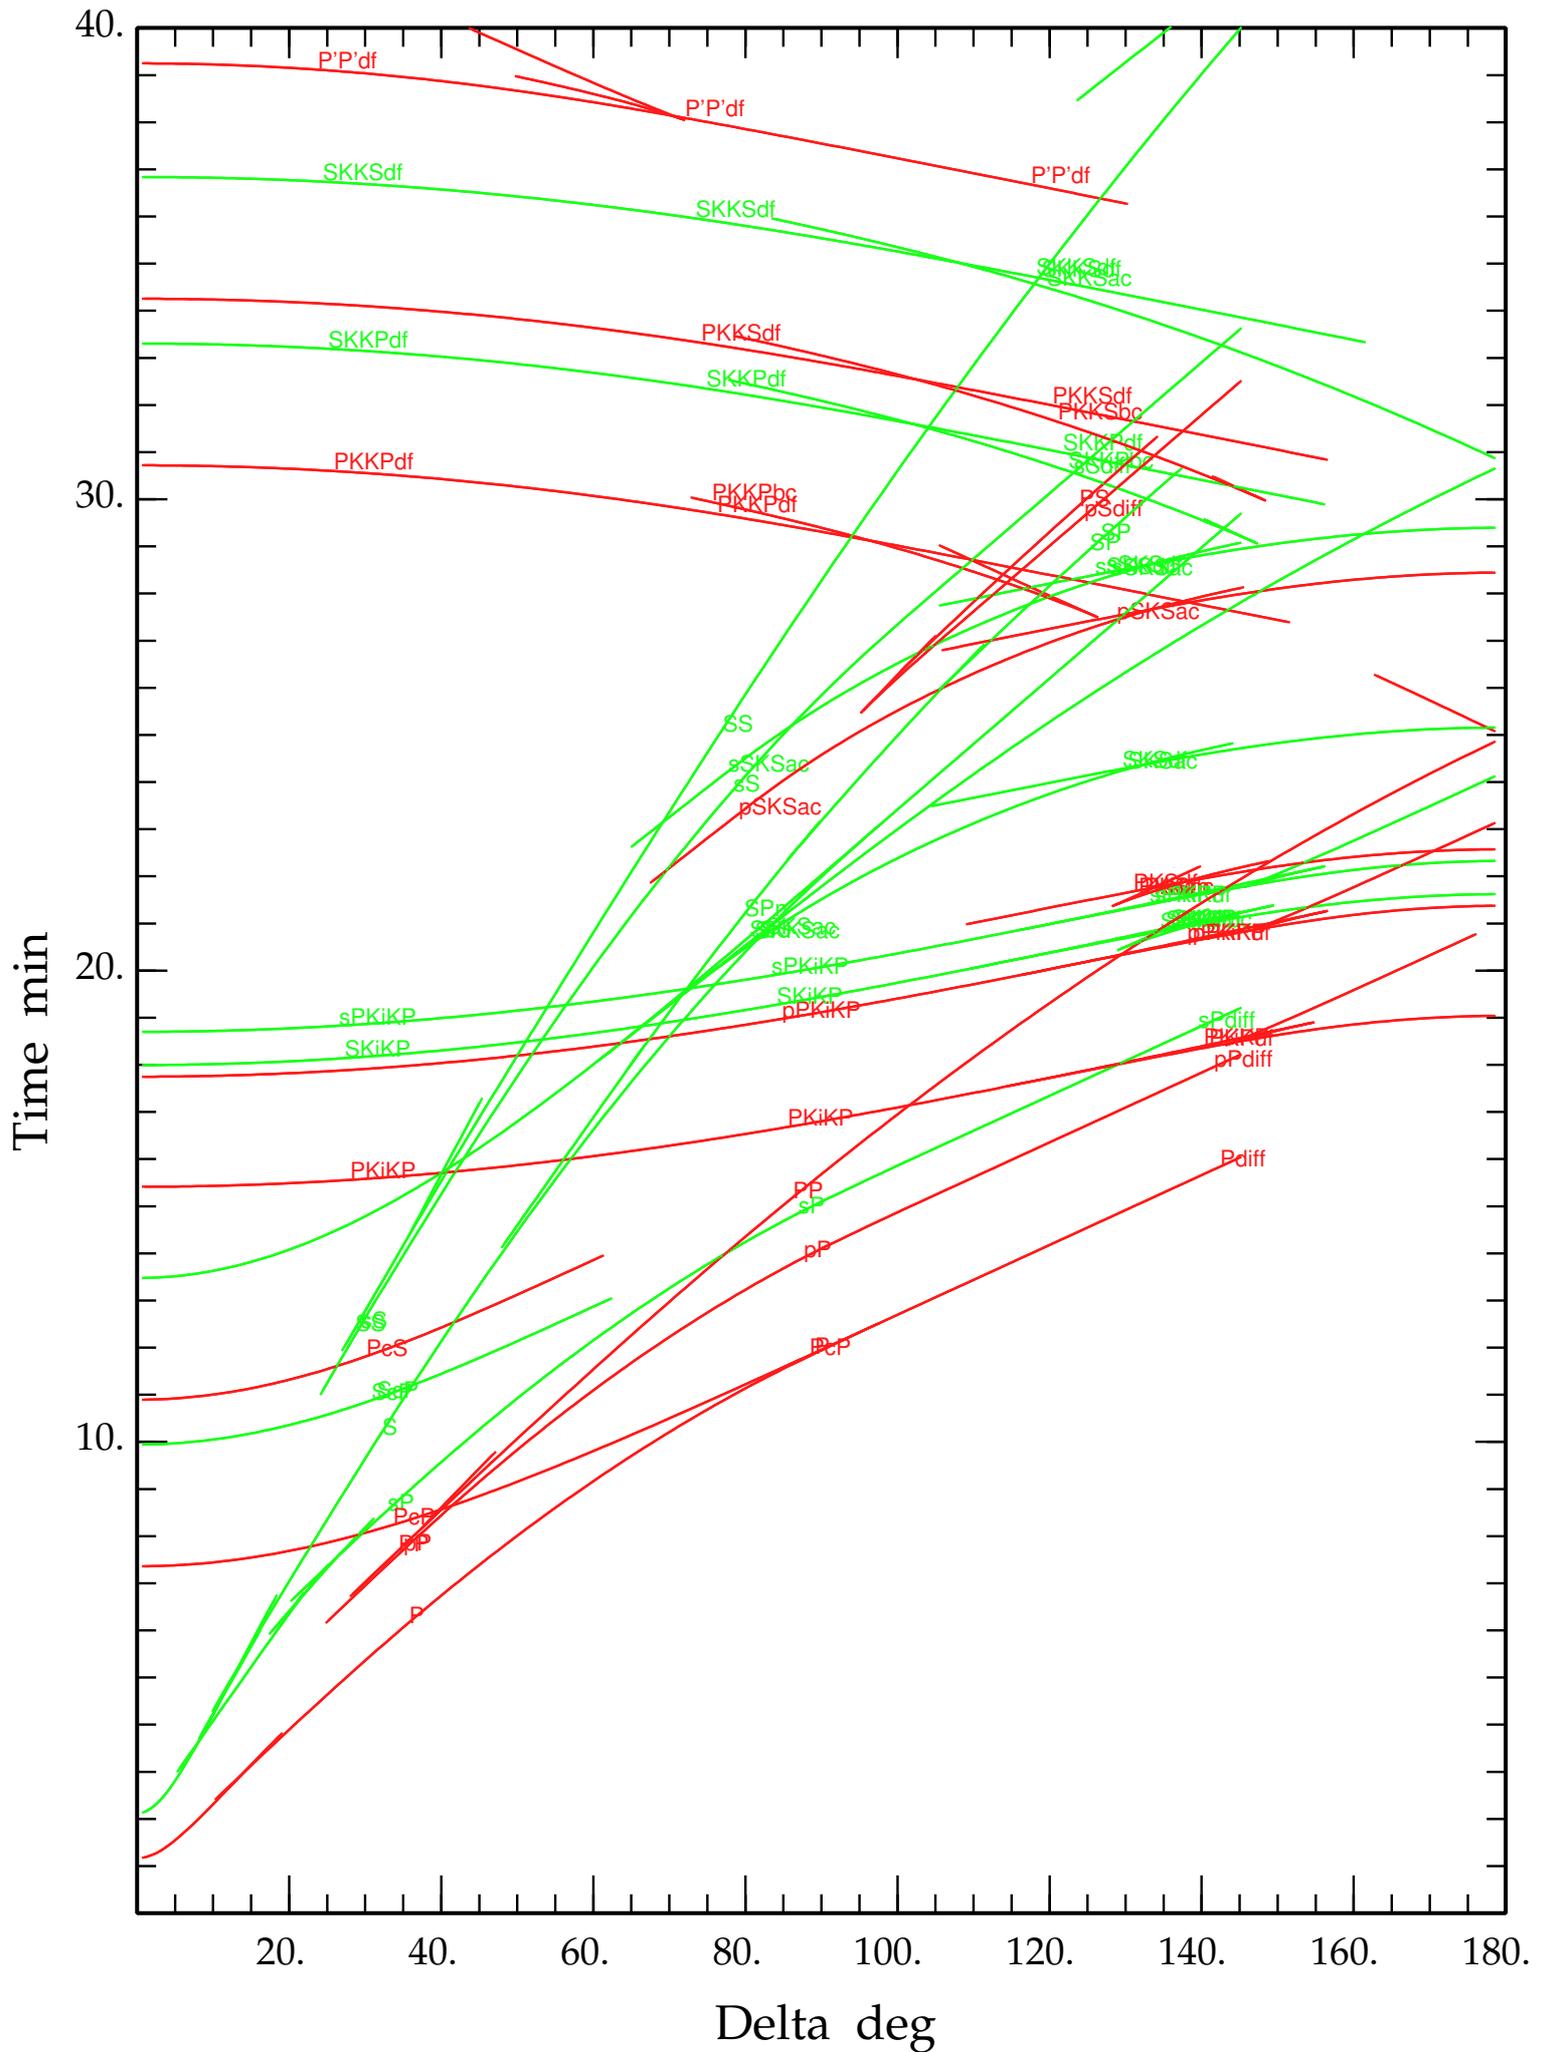

ak135 0 km depth

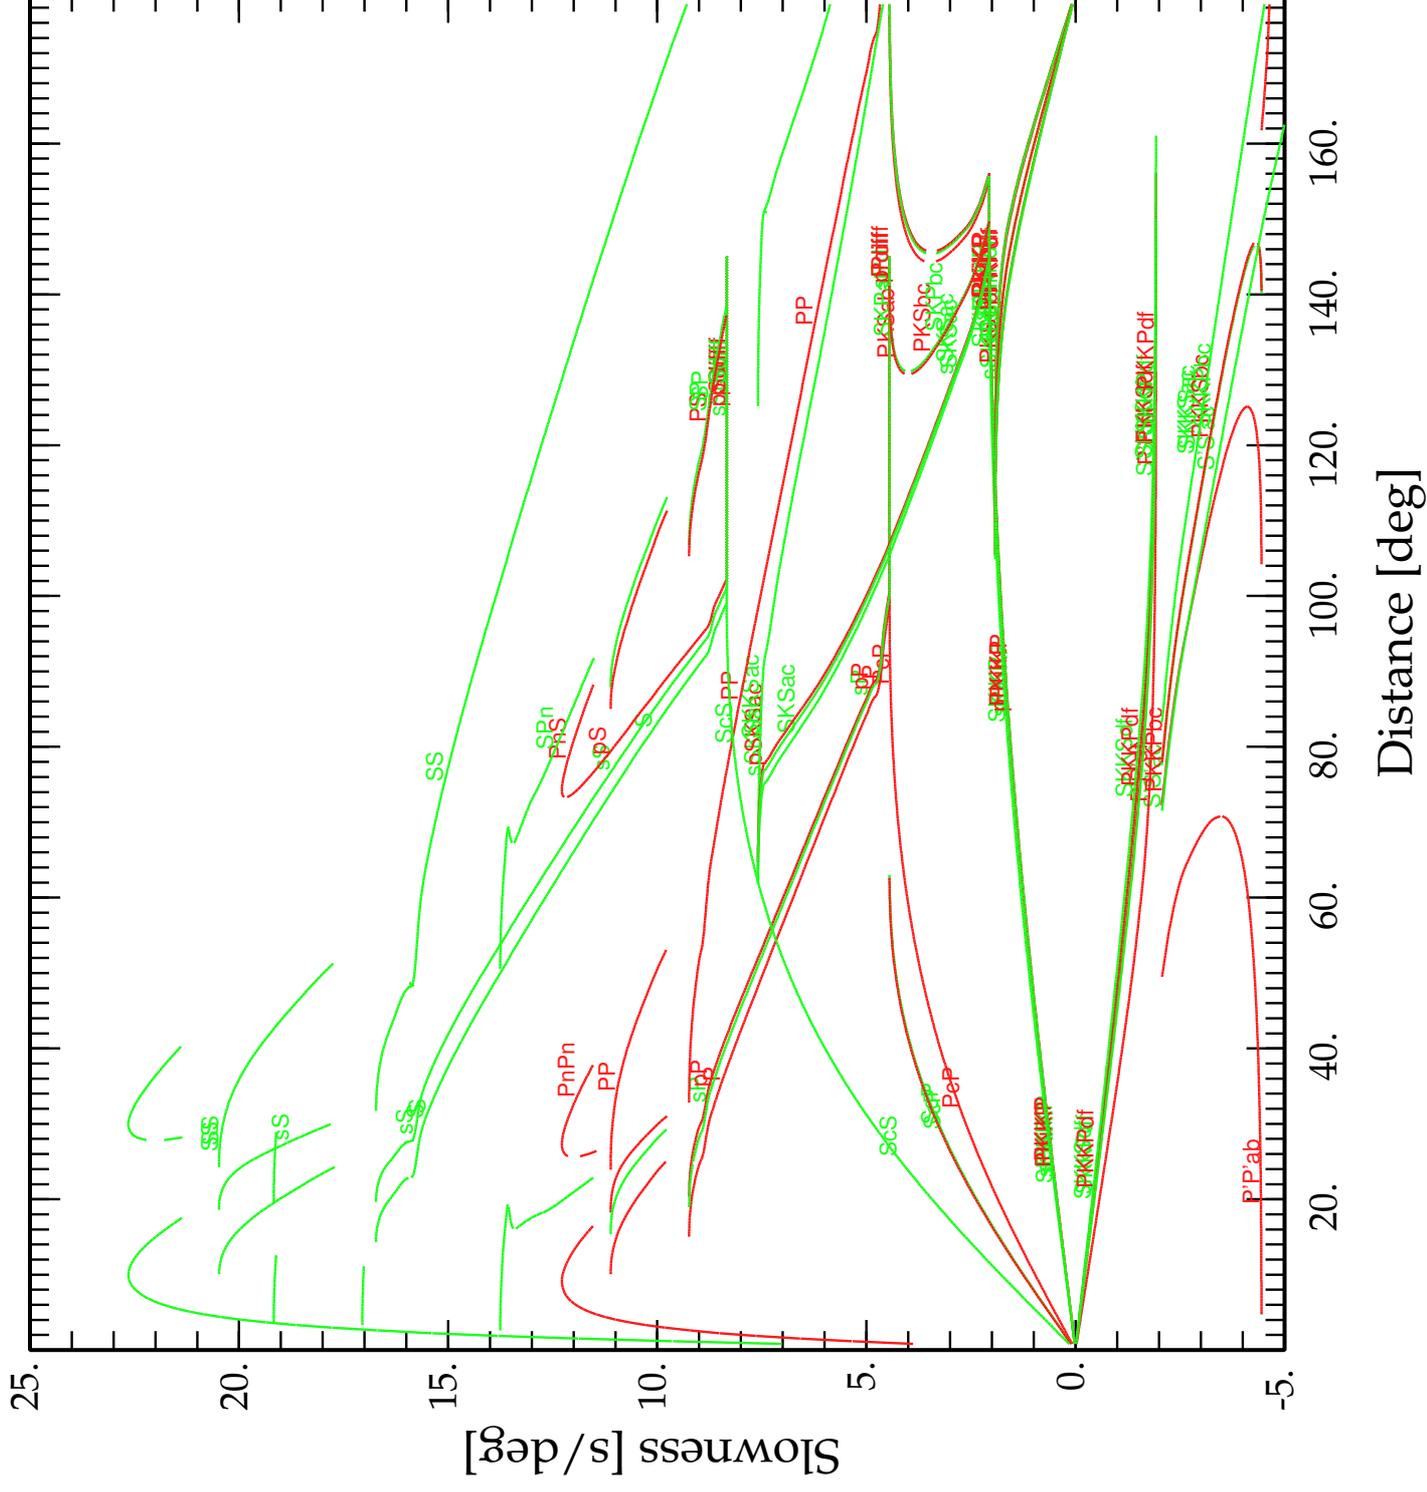

ak135 600 km depth

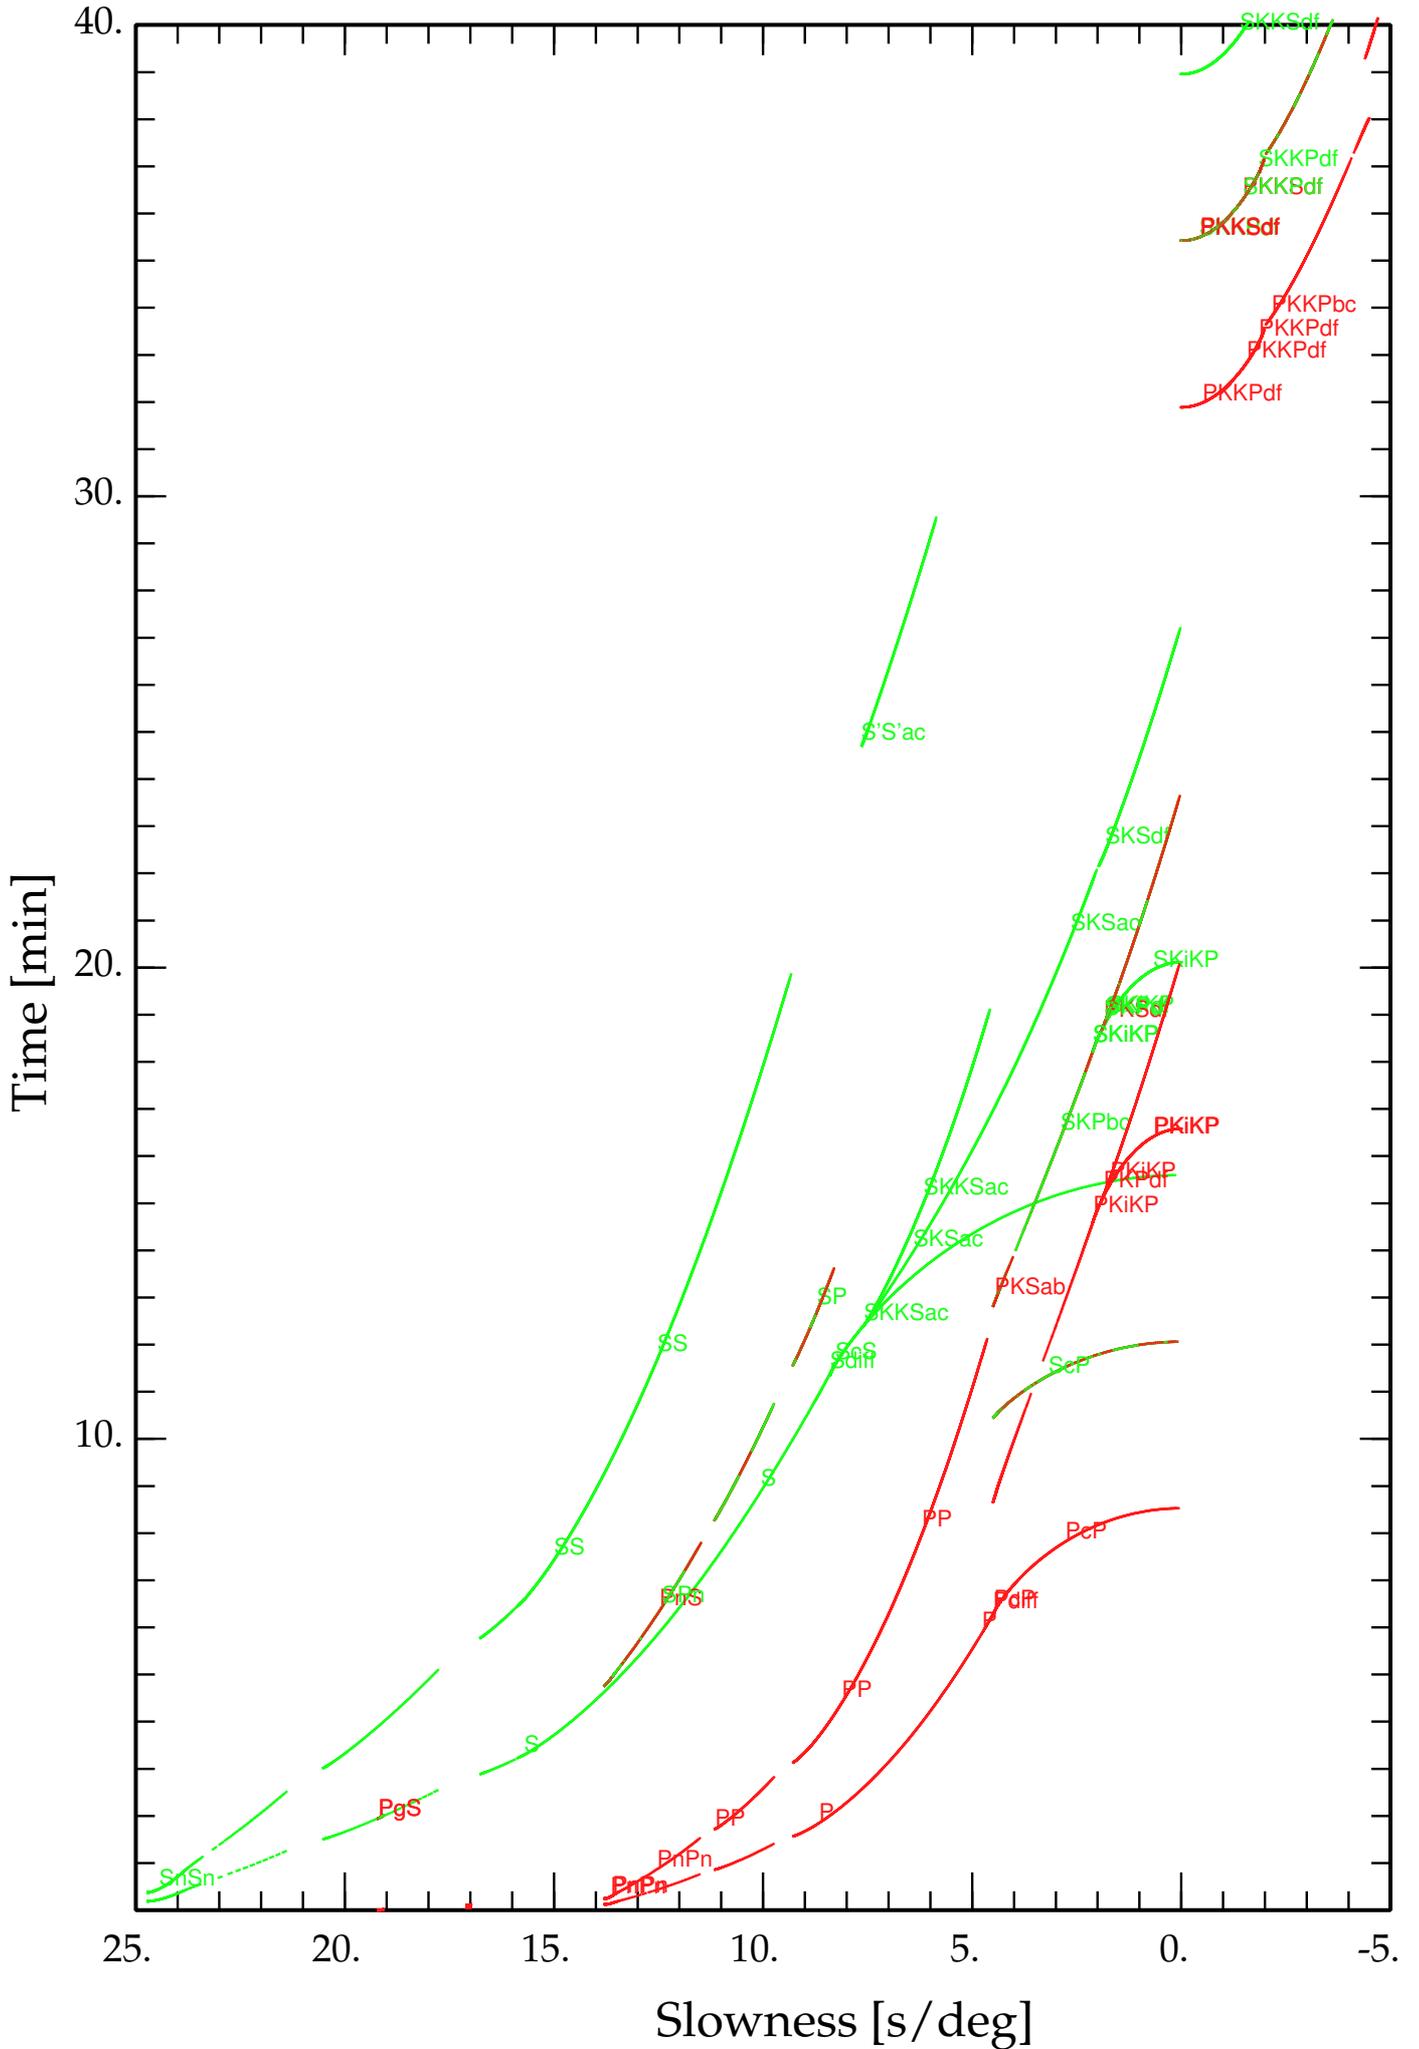

ak135 300 km depth

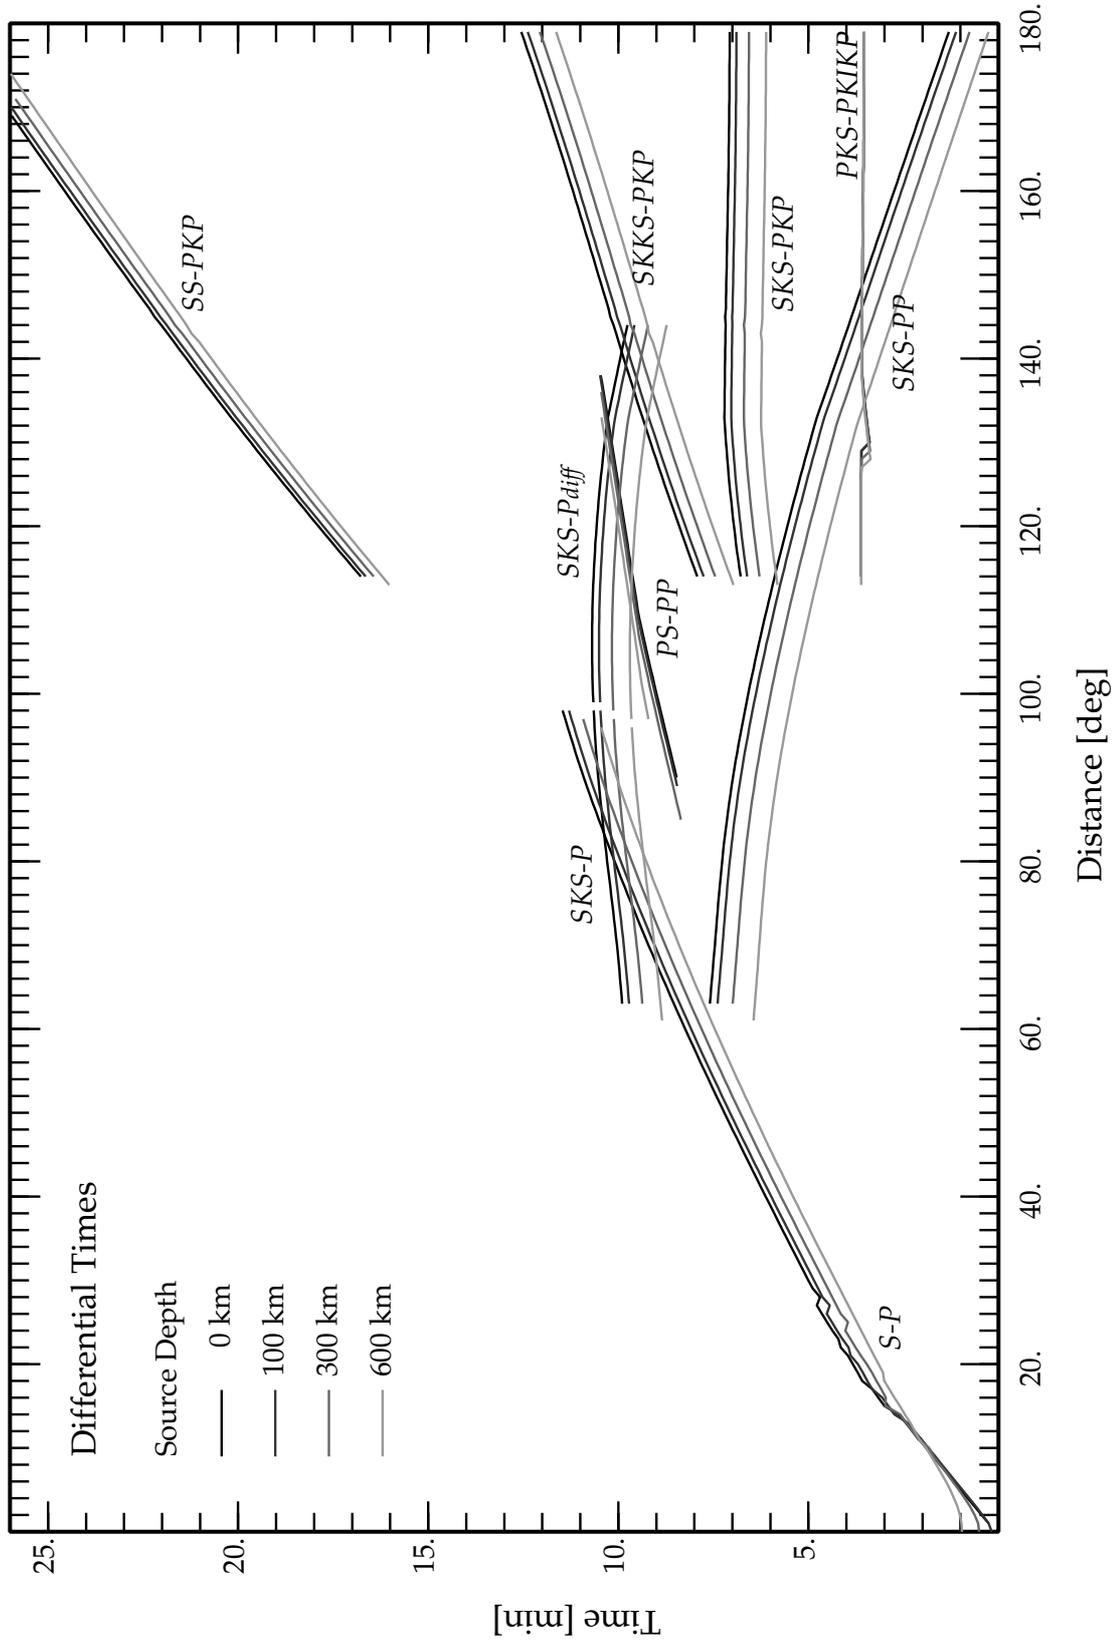

ak135 tau 0 km depth

## Ellipticity Correction Tables

These tables present the corrections for the ellipticity of the Earth at 5° intervals in the formulation of Dziewonski & Gilbert (1976) for the following phases:

Pup, P, Pdiff, PKPab, PKPbc, PKPdf, PKiKP  
pP, pPKPab, pPKPbc, pPKPdf, pPKiKP  
sP, sPKPab, sPKPbc, sPKPdf, sPKiKP  
PcP, ScP, SKPab, SKPbc, SKPdf, SKiKP  
PKKPab, PKKPbc, PKKPdf  
SKKPab, SKKPbc, SKKPdf, PP, P'P'

Sup, S, Sdiff, SKSac, SKSdf,  
pS, pSKSac, pSKSdf, sS, sSKSac, sSKSdf,  
ScS, PcS, PKSab, PKSbc, PKSdf,  
PKKSab, PKKSbc, PKKSdf, SKKSac, SKKSdf,  
SS, S'S', SP, PS, PnS

at source depths of 0, 35, 50, 100, 200, 300 and 700 km.

For each source depth the values of the three correction coefficients  $\tau_0, \tau_1, \tau_2$  are given as a function of epicentral distance.

### *Ellipticity time correction*

Consider a source with epicentral colatitude  $\theta$ . For epicentral distance  $\Delta$  and azimuth  $\zeta$ , from the epicentre to the receiver:  
the ellipticity correction in seconds is:

$$\delta t = \frac{1}{4}(1 + 3 \cos 2\theta)\tau_0(\Delta) + \frac{\sqrt{3}}{2}\sin 2\theta \cos \zeta \tau_1(\Delta) + \frac{\sqrt{3}}{2}\sin^2 \theta \cos 2\zeta \tau_2(\Delta)$$

and is to be added to the values for the spherically symmetric earth model presented in these tables.

*ak135*
